## Content Management System (CMS) Website

A web content management system is a content management system with additional features to ease the tasks required to publish web content to web sites.

Our CMS solution includes the following features:

- A fact finding consultation to assess your requirements and offer guidance on a suitable solution specifically for you
- Bespoke web site design
- Basic Meta tagging for search engine optimisation
- Up to 10 initial web pages, with additional pages available (for additional cost) or that can be simply updated by the client via a secured web control panel interface
- POP 3 Email accounts set up
- A contact us form
- The CMS offers large scope for customization through additional modules, for example photo galleries, contact management, newsletters, online forums, club management etc. We can offer advice on what is available and how it fits in with your plans.
- We can offer help and training if you wish to maintain the website yourself after it is delivered
- Ideally the customer will supply all images and content to us in a digital format. Contact us for a personal quotation, please [click here](#). Or to see some examples from our portfolio please [click here](#).
